Test Summary Report

E-Ticaret Web Uygulaması — Manuel Test (Project 1)

Document: Test Summary Report

Project: E-Commerce Manual Testing Portfolio Project — Project 1

Application Under Test: Practice Software Testing (Toolshop Demo) — https://practicesoftwaretesting.com

Prepared By: Nur Önel

Test Period: 12 October 2026 – 11 November 2026

1. Purpose

This report summarizes the results of the manual testing activities carried out under Project 1, as defined in the accompanying Test Plan. It presents test execution statistics, a consolidated defect summary, key findings, and an overall assessment of the application's quality at the conclusion of testing.

2. Scope of Testing (Recap)

Testing covered five functional and technical areas of the Practice Software Testing (Toolshop) demo application: Login, Signup/Registration, Shopping Cart, REST API (via Postman), and browser-level analysis via Chrome DevTools (Console, Network, and Lighthouse performance). Full scope details, including items explicitly out of scope (mobile testing, STLC simulation, and test automation — covered separately or deferred), are documented in the Test Plan.

3. Test Execution Summary

Feature Area	Test Cases	Passed	Failed	Pass Rate
Login	20	19	1	95%
Signup	12	7	5	58%
Cart	18	16	2	89%
API	13	13	0	100%
DevTools Analysis	10	10	0	100%
Total	73	65	8	89%

A total of 73 test cases and checks were executed across all five areas, with an overall pass rate of 89%. The Signup area had the lowest pass rate (58%), driven primarily by password-related validation and feedback issues (BUG-002, BUG-003) and an address auto-fill defect (BUG-004). The API and DevTools Analysis areas achieved a 100% pass rate at the test-case level — meaning their core functional expectations held, even where secondary defects were separately logged (see Section 4).

4. Defect Summary

A total of 11 defects (BUG-001 through BUG-011) were identified and logged, each with a Word/PDF bug report and a corresponding Jira Cloud ticket. Defects were classified by Severity (Critical / Major / Minor / Trivial) and Priority (High / Medium / Low), and grouped by root cause rather than duplicated by symptom or test case.

4.1 Defects by Severity

Severity	Count	% of Total
Major	4	36%
Minor	4	36%
Trivial	3	27%

4.2 Defects by Priority

Priority	Count	% of Total
High	2	18%
Medium	3	27%
Low	6	55%

No Critical-severity defects were found. The most severe category observed was Major (4 defects, 36%), reflecting functional correctness issues (e.g. login case-sensitivity, cart total not recalculating) rather than application-breaking failures — the application remained usable throughout testing even where these defects occurred.

5. Defect List

ID	Title	Area	Severity	Priority	Jira
BUG-001	Login fails with valid credentials when email is entered in uppercase.	Login	Major	High	KAN-1
BUG-002	Password validation error messages do not reflect the actual rule violated.	Signup	Minor	Medium	KAN-2
BUG-003	Password strength indicator does not display any level for a fully valid strong password.	Signup	Minor	Low	KAN-3
BUG-004	Auto-filled City and State fields do not match the entered postal code during sign up.	Signup	Major	Medium	KAN-4

ID	Title	Area	Severity	Priority	Jira
BUG-005	Cart grand total does not update when quantity is changed directly in the quantity input field.	Cart	Major	High	KAN-5
BUG-006	No validation message is shown when an invalid quantity (0) auto-corrects itself.	Cart	Minor	Low	KAN-7
BUG-007	Expected 401 session-check request on page load is logged as a console error instead of being handled silently.	DevTools	Minor	Low	KAN-8
BUG-008	Google Analytics 4 is initialized with deprecated parameters, logging a console warning on every page load.	DevTools	Trivial	Low	KAN-9
BUG-009	Uncaught TypeError ("Cannot read properties of null (reading 'cart_items')") is repeatedly thrown when the cart quantity is updated.	DevTools	Major	Medium	KAN-10
BUG-010	An image resource is preloaded with link rel="preload" but never used, logging a console warning on the checkout page.	DevTools	Trivial	Low	KAN-11
BUG-011	A Cloudflare challenge-platform script fails to load (400 Bad Request), logging a console error after login.	DevTools	Trivial	Low	KAN-12

6. Key Findings & Notable Observations

- BUG-001 (Login, Major/High): the login form rejects valid credentials when the email is entered in uppercase, suggesting the backend performs a case-sensitive email comparison — a common but impactful oversight, since users frequently enter email addresses inconsistently.
- BUG-005 (Cart, Major/High): the cart's grand total silently fails to recalculate when quantity is changed via the input field, while the line total updates correctly — a discrepancy a user could easily miss, with direct impact on what they believe they are paying.
- BUG-009 (DevTools, Major/Medium): an uncaught TypeError fires on every cart re-render when quantity changes, scaling from 13 to 33 repeated console errors as more of the checkout flow was exercised — no visible UI impact was observed, but the pattern indicates a missing null-check in the cart component's state handling.
- A positive security finding (not a defect): the registration API correctly rejected a password that matched a known data-breach list, and correctly returned 409 Conflict on duplicate email registration — demonstrating sound server-side validation in the API layer, in contrast to some of the front-end issues found elsewhere.
- Several DevTools findings (BUG-007, BUG-008, BUG-010, BUG-011) were Minor/Trivial code-quality or third-party infrastructure issues (console noise, deprecated analytics parameters, unused resource preloading, a failing Cloudflare script) — none with user-facing functional impact, but all worth addressing for code cleanliness.
- Testing combining Postman (API layer) and Chrome DevTools (browser/console layer) with the same /users/me endpoint confirmed that the backend API itself behaves correctly and consistently (verified via Postman), while several of the console-level issues originate specifically from how the front-end consumes that API (e.g. logging an expected 401 as an error) — illustrating how different test layers surface different classes of defects on the same underlying feature.

7. Risks & Limitations Encountered

- The public demo environment's test data (registered accounts) was periodically reset by the site maintainers, requiring re-registration of a test account mid-project on at least one occasion.
- The application's session timeout (~1 hour) occasionally caused unexpected logouts during longer test sessions, which was itself used as a useful (non-defect) data point during DevTools testing.
- A subset of findings (e.g. BUG-011, the Cloudflare script failure) originate from third-party infrastructure rather than the application's own codebase, and are documented for completeness rather than as directly actionable application defects.

8. Conclusion

Overall, the Practice Software Testing (Toolshop) demo application demonstrated solid core functionality across login, registration, cart, and API layers, with an 89% overall test pass rate and no Critical-severity defects identified. The defects found were concentrated in input validation feedback (Signup), state synchronization (Cart total, Cart re-render TypeError), and minor front-end code-quality issues (DevTools findings) — none of which prevented a user from successfully completing core shopping flows during testing.

9. Recommendations

- Prioritize fixing the two High-priority defects first: BUG-001 (case-sensitive login) and BUG-005 (cart total not recalculating), as both directly affect core user-facing flows.
- Address BUG-009's root cause (missing null-check in the cart component) given its Major severity and the fact that its error count scales with user interaction — a good candidate for a unit/component-level regression test once fixed.
- Clean up the Minor/Trivial DevTools findings (console noise, deprecated analytics parameters) as routine code-quality maintenance.
- Consider introducing automated regression tests for the highest-value flows (login, cart total calculation) covered in this project, to catch regressions earlier in future development cycles.
