Bug ID: BUG-002

Title: Password validation error messages do not reflect the actual rule violated.

Environment :

Application: Practice Software Testing (Toolshop Demo)
URL: https://practicesoftwaretesting.com
Page: Sign Up page
Browser: Opera browser

Preconditions: User is on the Sign Up page attempting to register with a password that violates exactly one of the four stated password rules.

Steps to Reproduce:

1. Open the Sign Up page.
2. Fill in all fields with valid data.
3. Enter a password that violates only one specific rule (e.g. missing uppercase, missing a number, or missing a special character).
4. Click "Kaydol".
5. Observe the error message shown.

Expected Result: The error message should clearly describe which specific password rule was violated (e.g. "Password must contain an uppercase letter").

Actual Result: The same generic message, "Şifre, geçersiz karakterler içermemelidir." (Password must not contain invalid characters), is shown regardless of which rule is actually violated — observed consistently across TC-SIGNUP-006 (missing uppercase), TC-SIGNUP-007 (missing number), and TC-SIGNUP-008 (missing special character). This message is misleading since no invalid characters were actually used.

Severity: Minor

Priority: Medium

Evidence:

Evidence/Screenshots/TC-SIGNUP-006_missing_uppercase_error.png
Evidence/Screenshots/TC-SIGNUP-007_missing_number_error.png
Evidence/Screenshots/TC-SIGNUP-008_missing_special_character_error.png

Related Test Case: TC-SIGNUP-006, TC-SIGNUP-007, TC-SIGNUP-008
