Bug ID: BUG-011

Title: A Cloudflare challenge-platform script fails to load (400 Bad Request), logging a console error after login.

Environment :

Application: Practice Software Testing (Toolshop Demo)
URL: https://practicesoftwaretesting.com/account
Page: Account page (post-login)
Browser: Chrome

Preconditions: User logs in with valid credentials.

Steps to Reproduce:

1. Log in with valid credentials.
2. Open Chrome DevTools, go to the Console tab.
3. Navigate to the Account page (or observe right after login).
4. Observe the console for errors.

Expected Result: All third-party scripts loaded by the page, including security/bot-protection scripts, should load successfully without producing console errors.

Actual Result: After a successful login, the console displayed a red error: "GET https://practicesoftwaretesting.com/cdn-cgi/challenge-platform/h/g/scripts/jsd/5c2e6b612edd/main.js net::ERR_ABORTED 400 (Bad Request)". This request targets Cloudflare's challenge-platform (bot protection) script, which is third-party infrastructure rather than the application's own code; the failure is likely outside the direct control of the Toolshop development team, but is still documented here since it is a real console error observed during normal use. No functional impact on login or the account page was observed.

Severity: Trivial (Third-party / Infrastructure)

Priority: Low

Evidence:
