# Test Plan

*E-Ticaret Web Uygulaması — Manuel Test (Project 1)*

**Document:** Test Plan

**Project:** E-Commerce Manual Testing Portfolio Project — Project 1

**Application Under Test:** Practice Software Testing (Toolshop Demo) — https://practicesoftwaretesting.com

**Prepared By:** Nur Önel

**Date Range:** 12 October 2026 – 11 November 2026

## 1. Introduction / Objective

This Test Plan defines the scope, approach, resources, and schedule of the manual testing activities performed on the Practice Software Testing (Toolshop) demo e-commerce application. The purpose of this project is to demonstrate manual QA testing skills — including functional testing, negative testing, API testing, and browser-level (DevTools) analysis — as part of a personal portfolio supporting a QA job application.

The application under test is a public demo e-commerce site built specifically for practicing manual and automated testing techniques. It includes standard e-commerce functionality such as user registration, login, product browsing, cart management, and checkout.

## 2. Scope

### 2.1 In Scope

- Login functionality — functional and negative testing
- Signup / Registration — functional and negative testing, including boundary value analysis
- Shopping Cart — functional and negative testing, including quantity updates and total recalculation
- REST API testing (via Postman) — login, product listing, authenticated user profile (/users/me), registration
- Browser-level analysis via Chrome DevTools — Console errors/warnings, Network request inspection, page load performance (Lighthouse)

### 2.2 Out of Scope

- Mobile application testing (covered separately in Project 2 — Exploratory & Regression Testing)
- Full end-to-end STLC simulation (covered separately in Project 3)
- Test automation (deferred — planned as a possible future addition, not part of this project's current scope)
- Completion of real payment transactions (checkout was tested up to the payment step, without finalizing a real order)
- Load/stress/performance testing beyond single-page Lighthouse measurements
- In-depth security/penetration testing beyond basic observations (HTTPS usage, password transmission)

## 3. Test Approach

- Manual black-box testing techniques: functional (positive) and negative test cases for each feature area.
- Equivalence partitioning and boundary value analysis applied to input fields (e.g. registration form, quantity fields).
- API testing performed manually using Postman — requests constructed and verified against expected status codes and response bodies.
- Browser-level analysis performed using Chrome DevTools — Console tab for JavaScript errors/warnings, Network tab for request/response inspection, and Lighthouse for page performance scoring.
- Defects classified by Severity (Critical / Major / Minor / Trivial) and Priority (High / Medium / Low), and tracked as tickets on a Jira Cloud Kanban board.
- Defects are grouped by root cause rather than by symptom or test case — when a new finding shares the same underlying cause as an already-logged defect, it is referenced on the existing ticket instead of being duplicated.
- A test case may be marked PASS on its core functional expectation while a secondary, lower-severity observation is logged as a separate defect, rather than failing the entire test case.

# 4. Test Environment

**Application URL:** https://practicesoftwaretesting.com

**API Base URL:** https://api.practicesoftwaretesting.com

**Browser:** Google Chrome (Desktop)

**Operating System:** Windows

**Tools Used:** Postman (API testing), Chrome DevTools (console/network/performance analysis), Jira Cloud (defect tracking), Microsoft Excel (test case documentation), Microsoft Word / PDF (bug reports), Git & GitHub (version control and portfolio hosting)

# 5. Test Deliverables

- Test Case documents (Excel): Login_Test_Cases.xlsx, Signup_Test_Cases.xlsx, Cart_Test_Cases.xlsx, API_Test_Cases.xlsx, DevTools_Analysis.xlsx
- Bug Reports (Word / PDF, BUG-001 through BUG-011), each including an appended Jira Tracking page
- Jira Cloud tickets (KAN board) corresponding to every logged defect
- Postman Collection export: Toolshop API Tests.postman_collection.json
- Evidence screenshots for every test case and defect (Evidence/Screenshots/)
- This Test Plan document
- Test Summary Report (final deliverable of Project 1, to be produced after this Test Plan)

# 6. Entry / Exit Criteria

## 6.1 Entry Criteria

- The test environment (demo application) is accessible and stable.
- Test case documents for the relevant feature area have been designed in advance.
- Required tools (Postman, Jira, Chrome DevTools) are set up and accessible.

## 6.2 Exit Criteria

- All planned test cases for the feature area have been executed and their results (PASS/FAIL) documented.
- All identified defects have been logged with a Word/PDF bug report and a corresponding Jira ticket.
- All supporting evidence (screenshots, Postman collection) has been collected and stored in the repository.
- Known environment limitations have been documented (see Section 8).

## 7. Roles & Responsibilities

As this is an individual portfolio project, all testing roles — test planning, test case design, test execution, defect logging, and reporting — were performed by Nur Önel. AI-assisted guidance (Claude) was used throughout for test design review, QA concept coaching, and documentation support, with all test execution performed manually and personally by the tester.

## 8. Risks & Limitations

- The application is a public demo environment shared by testers worldwide; registered test accounts and data may be periodically reset by the site maintainers, occasionally requiring re-registration of a test account mid-project.
- The application's session timeout was observed to be approximately 1 hour; long test sessions may require re-login.
- Some findings (e.g. a failing Cloudflare challenge-platform script) originate from third-party infrastructure rather than the application's own code, and are documented for completeness rather than as actionable application defects.
- Chrome DevTools' Network response-body inspection can fail to load data after the page has navigated away from the request's context; this is a known tooling limitation, not an application defect.

## 9. Test Summary (Overview)

A detailed breakdown of test results, defect statistics, and conclusions is provided separately in the Test Summary Report. In brief, this project covered 5 functional/technical areas (Login, Signup, Cart, API, DevTools Analysis) comprising over 60 individual test cases and checks, resulting in 11 logged defects (BUG-001 through BUG-011), all tracked to resolution-ready status on a Jira Cloud board.
